**Instructions to Students**

- Answer BOTH questions. Each question carries 50 Marks. Total: 100 Marks.
- Draw a clear and neat concept map for each question.
- Identify all key concepts and arrange them in a logical hierarchy.
- Show meaningful linkages between concepts using arrows and connecting words.
- Compare related concepts wherever required and justify the relationships clearly.
- Ensure the concept map is well-organized, readable, and properly labelled.

### RUBRICS FOR CALCULATION

| Criteria                         | Wt. | Level 4 – Exemplary                                                        | Level 3 – Proficient                                  | Level 2 – Developing                           | Level 1 – Beginning                                    |
|----------------------------------|-----|----------------------------------------------------------------------------|-------------------------------------------------------|------------------------------------------------|--------------------------------------------------------|
| Understanding of Problem Context | 20% | Clearly understands the problem and accurately identifies all requirements | Good understanding with minor gaps                    | Basic understanding; some requirements unclear | Poor understanding or misinterpretation of the problem |
| Application of Concepts          | 30% | Accurately applies appropriate concepts to solve complex problems          | Applies relevant concepts correctly with minor errors | Applies basic concepts with limited accuracy   | Fails to apply appropriate concepts                    |
| Problem-Solving Approach         | 20% | Logical, well-structured, and efficient approach                           | Mostly logical approach with minor gaps               | Basic approach with some inconsistencies       | Illogical or unclear approach                          |
| Accuracy of Solution             | 20% | Completely correct solution with proper justification                      | Mostly correct with minor errors                      | Partially correct solution                     | Incorrect or incomplete solution                       |
| Clarity                          | 10% | Clear, well-organized, and properly explained solution                     | Understandable with minor clarity issues              | Limited clarity and explanation                | Poorly presented and difficult to understand           |

### Marks Evaluation:

| Question No.               | Understanding of Problem Context (20%) | Application of Concepts (30%) | Problem-Solving Approach (20%) | Accuracy of Solution (20%) | Clarity (10%) | Total Marks |
|----------------------------|----------------------------------------|-------------------------------|--------------------------------|----------------------------|---------------|-------------|
| <b>Q1</b><br>(50 Marks)    |                                        |                               |                                |                            |               |             |

## Assignment-2

Q. Concept Map : Algorithm  $\rightarrow$  Time complexity  $\rightarrow$  Asymptotic Notation

Concept map

### Explanation Of Relationships

Algorithm  $\rightarrow$  Time Complexity

An algorithm is a step by step procedure used to solve a problem. Time complexity measures how the running time of an algorithm grows as the input size ( $n$ ) increases.

## Time Complexity $\rightarrow$ Asymptotic Notation

Asymptotic notation is used to mathematically describe the growth rate of an algorithm's time complexity without depending on hardware or exact execution time.

### Asymptotic Notations

**Big-O ( $O$ ):** Represents the upper bound, commonly used to describe the worst case growth of an algorithm.

**Big-omega ( $\Omega$ ):** Represents the lower bound commonly used to describe the best-case growth.

**Big-Theta ( $\Theta$ ):** Represents the tight bound and same describing the algorithm's growth rate when both upper and lower bounds are the same.

### Case Analysis

**Best case analysis** - Determines the minimum time required when the input is in the most favourable condition. It is often represented using  $\Omega$ .

Average - case analysis :

Determines the expected running time for typical or standard inputs. It is often represented using  $\theta$

Worst case analysis

Determines the maximum time required for the most unfavorable input. It is commonly represented using  $O$

Example

Consider linear search of array of size  $n$

Case - Best case

Situation time - Element is found at the first position

Time -  $\Omega(1)$

Case - Average case

Situation time - Element is found around in the middle of

Time -  $\theta(n)$

Case - Worst case

Situation time - Element is the last position or absent

Time -  $O(n)$

## Conclusion

The concept map shows how an abstract algorithm is converted into a measurable efficiency metric through time complexity and asymptotic notation.

The best case, average case & worst case branches provide different perspectives on performance.
